                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel protein, human protein 36-41, and the DNA sequence encoding it. The protein of the invention may be useful for the treatment of diseases such as arrhythmia, asthma and dementia. The present sequence is the amino acid sequence of a peptide fragment of human protein 36-41 which was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human macroprotein-36.41, encoding polynucleotide, antagonist recombinant production, useful for treating dementia, arrhythmia, and digestive ulcers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a novel monoclonal antibody (I) that consectifically binds to a mammalian IgE epitope, where the epitope is CC between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. CC (I) is useful for testing an allergen reactivity of an IgE sample. The CC and corn allergens. The sample is a biological sample collected from a CC dog, cat or horse. (I) is also useful for detecting mammalian IgE and for CC treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal CC antibodies recognise epitopes on canine IgE corresponding to amino acid CC residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC cat, horse, pig and horse, but did not exhibit cross-reactivity with the epsilon-chain CC cither pig or human epsilon-chains of IgE. The present sequence is the CC corresponding or human epsilon-chains of IgE. The present sequence is the CC corresponding or human epsilon site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Immunogenic composition comprising an isolated equine immunoglobulin polypeptide that induces production of antibodies which specifically to equine immunoglobulin E.

E bind

Example 1; Page 8; 14pp; English.

```
CC antibody that specifically binds to equine immunoglobulin (1g)E), the six CC polypeptides are not explicitly identified in the specification. Also CC included are a composition comprising an antibody that specifically binds to equine IgE made by the process of immunising an animal with a polypeptide at least 80% identical to (S1)-(S6), an antibody that specifically binds to equine IgE made by the process of immunising an CC antibody that specifically binds to equine IgE (involving immunising an CC amino acid sequence of the polypeptide is at least 80% identical to (S1)-(S6), making an CC amino acid sequence of the polypeptide is at least 80% identical to (S1)-(CC (S6)), and collecting antiserum from the antibody and means CC of equine IgE in a biological sample comprising the antibody and means CC for detecting specific binding of the antibody to equine IgE. The CC sample (serum) which involves contacting the sample with the antibody. CC thus forming an antigen/antibody complex, and detecting the presence or complex can be detected. The complex is detected using a second labelled complex can be detected. The complex is detected using a second labelled complex can be detected. The complex is detected using a second labelled complex is a Horse immunoglobulin E, IgE, heavy chain immunogenic cc peptide from the middle portion of the C2 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           contain a nucleic acid encoding a mutant HSV protein or a nucleic acid encoding the polypeptide sufficient for virus-like particle assembly but devoid of late-domain motifs. The nucleic acid is within an HSV genome. The genome is devoid of late domain motifs capable of effecting viral budding. The composition also comprises a compound capable of interfering with the protein-protein interaction between a host cell protein capable of binding a late domain motif and a HSV protein containing a late domain motif. The composition further comprises another HSV protein or its immunogenic fragment, and/or a nucleic acid encoding the other HSV protein or the immunogenic fragment. The present sequence is a mutant HSV peptide, derived from the wild-type peptide ADJ38596, used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to cells displaying herpes simplex virus (HSV) altered budding phenotype which are useful for the manufacture of a medicament for treating HSV infection. The medicament further comprises an adjuvant capable of stimulating cellular immune response e.g. IL-2, IL-4, IL-12, IL-18 or gamma-interferon. The cells are human cells and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The present invention relates to cells displaying herpes simplex virus CC (HSV) altered budding phenotype which are useful for the manufacture of a medicament for treating HSV infection. The medicament further comprises CC an adjuvant capable of stimulating cellular immune response e.g. IL-2, IL-2 (CC -4, IL-12, IL-18 or gamma-interferon. The cells are human cells and CC contain a nucleic acid encoding a mutant HSV protein or a nucleic acid cencoding the polypeptide sufficient for virus-like particle assembly but devoid of late-domain motifs. The nucleic acid is within an HSV genome. CC The genome is devoid of late domain motifs capable of effecting viral CC budding. The composition also comprises a compound capable of interfering with the protein protein interaction between a host cell protein capable CC with the protein or tell in the comprises another they protein or its comprises another they protein or the immunogenic fragment. The present sequence is a wild-type CC protein or the immunogenic fragment. The present sequence is a wild-type CC the contraction between the protein capable of the immunogenic fragment. The present sequence is a wild-type CC protein or the immunogenic fragment. The present sequence is a wild-type contracted for use in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for the identification of a CC therapeutic compound. The method involves providing test cells that CC express a target protein containing a DEF domain and MAP kinase; CC culturing the cells in the presence of growth factor, cytokine, tumor CC promoter or oncogene; contacting the cells with a candidate compound; and CC assessing the binding of the MAP kinase to the DEF domain relative to the binding in the absence of the candidate compound. The invention further CC comprises a method for the identification of a therapeutic compound; a CC method for treatment of cancer, which involves administering a compound CC that inhibits the binding of a MAP kinase to the DEF domain of a target CC protein; and an antibody that specifically binds to phospho-T-325 c-Fos (preferably polyclonal or monoclonal) The novel therapeutic compounds CC have the following activities: cytostatic, cardiovascular-gen., cardiant, CC antiallergic, immunosuppressive, antibacterial, antiallammatory, CC antiallergic, immunosuppressive, antibacterial, antiallammatory, CC antipyretic, uncopathic, antipsoriatic, hepatotropic, antianemic, muscular cgen., thyromimetic, antipsoriatic, hepatotropic, antianemic, muscular cgen., thyromimetic, antipsoriatic, hepatotropic, anticheumatic, cc., cardiovascular disorders, manbolic, hypertensive, annotectic, cancer, cardiovascular disorders, hypothe, annotectic, compound may be used in the treatment cof: cancer, cardiovascular disorders, inflammatory disorders, metabolic disorders, metabolic therapy target peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The antibodies comprise at least one complementarity determining region (CDR) of a heavy or light chain, a heavy chain or light chain variable region, or a heavy chain or light chain constant region. The anti-IL-12 antibodies are useful in methods for diagnosing or treating IL-12 related conditions, e.g. psoriasis or multiple sclerosis. The antibodies are also useful for treating immune, cardiovascular, infectious, malignant or neurological disorders or diseases. The present sequence represents the amino acid sequence of human anti-Interleukin-12 (IL-12) antibody CDR3 light chain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The invention relates to monoclonal antibodies that bind to human considerables in factor-3 (SAF-3). SAF-3 antibody is useful for treating or concerning cancer; inflammation, autoimmunity, allergy, asthma, central concerns system (CNS) inflammation, rheumatoid arthritis, multiple concerns, AIDS and bacterial, fungal, protozoan and viral infections and conformed to the conformation of the manumal, where the immune response is downregulated or enhanced. SAF-3 antibody is useful as diagnostic and therapeutic reagents, to subcharacterise cell populations during constitution of cancer cells expressing SAF-3, as a diagnostic marker to distinguish between different forms of cancer, to purge bone marrow except vivo of cancer cells expressing SAF-3, as a tool to aid in the exvivo constitution of cells expressing SAF-3, as a stimulus in vivo for stem cell constitution into the periphery and as an vivo chemoprotective agent.                            The invention relates to an antibody (I) that binds to a prostate cancer cell. Also described are the following: identifying (MI) antibodies specific to cancer cells, generating a phage displayed antibody library using cells collected from subjects immunized with cancer cells, removing members of the library that bind to human red blood cells to generate a
                                                                                                                                                                                                                                                                                             New antibody that binds to a prostate cancer cell, useful cancerous cells in vivo, for killing or ablating prostate vivo, and for delivering a variety of cytotoxic drugs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC hSARS virus having China Center for Type Culture Collection Deposit CC Accession No. CCTCC-V200303. The present invention also relates to novel CC nucleic acid molecules (1; ADT41483) or ADT41485) encoding a nucleocapsid-CC (N) or spike (8)-gene protein of a hSARS virus. Also disclosed are cc methods for detecting the presence of a N- or S-gene of the hSARS virus or of the protein in a biological sample and identifying a subject cinfected with the hSARS virus. The hSARS virus, nucleic acid and protein CC sequences are useful as vaccines for diagnosing or treating SARS. They CC are also useful in clinical and scientific research applications. The CC hSARS virus genome (ADT39027) was obtained and the amino acid sequences of all three reading frames were deduced from the complementary strand. ADT40120 is the full-length protein encoded by the first reading frame of the complementary strand and ADT40601 are the peptides from the first reading frame protein. ADT40602 is the full-length protein encoded by the second reading frame of the complementary strand and ADT40977 cis the full-length protein encoded by the third reading frame of the complementary strand and ADT40977 tis the full-length protein encoded by the full-length protein. ADT40977 cis the full-length protein encoded by the third reading frame of the complementary strand and ADT40977 the full-length protein encoded by the third reading frame of the complementary strand and ADT40977 cis the full-length protein encoded by the third reading frame of the complementary strand and ADT40977 third reading frame of the complementary strand and ADT40977 the full-length protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The present invention relates to novel human Severe Acute Respiratory Syndrome (hSARS) viral nucleic acid and protein sequences derived from a hSARS virus having China Center for Type Culture Collection Deposit Accession No. CCTCC-V200303. The hSARS virus, nucleic acid and protein sequences are useful as vaccines for diagnosing or treating SARS. They are also useful in clinical and scientific research applications. The hSARS virus genome (ADT36557) was obtained and the amino acid sequences of all three reading frames were deduced from the complementary strand. ADT37650 is the full-length protein encoded by the first reading frame c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid molecule consisting essentially of, and/or hybridizes under stringent conditions to a fully defined nucleotide sequence of 16-25 base pairs (bp; SEQ ID NO: 2471-2476), or its complement. The methods and compositions of the present invention are useful for the detection of the virus causing Severe Acute Respiratory Syndrome (SARS) in humans using a real-time quantitative polymerase chain reaction (PCR) assay. They can also be used in treating, ameliorating, managing or preventing SARS. This sequence corresponds to a partial SARS protein sequence from the complementary reading frame 1.
                                                                                                                                                                                                                                                                                        New isolated human severe acute respiratory syndrome useful as vaccine for diagnosing or treating SARS or scientific research applications.
                                                                                                                                                                                                                                                                                                                                                                                        HPI;
